

PROTECT YOUR TECH FROM NATURAL DISASTERS

- 1. Safeguard your hardware's physical assets**
Flood-proof your workspace and secure vital technology in waterproof and fireproof safes. Keep tech away from windows and unplug devices to avoid damage from a power surge or flood.
- 2. Back up your data**
Perform backups routinely and store data remotely. Keep a complete inventory of where your data is stored especially if you're using multiple platforms or systems.
- 3. Have a disaster plan in place**
Your emergency plan should cover everything you need, including where you can secure a backup laptop or portable power source.

➤ After any natural disaster, perform a risk assessment to identify what worked, what didn't, and what you should change in the event of another disaster.
